

## Project Brief

### Overview

A site which contains a database of topics which are continually updated with new stories done in a wikipedia style where anybody can add/edit stories.

Example: I create a topic page - "Barack Obama" and I update with stories about what he is doing in his life. Stories are listed chronologically.

### Design Overview

### Pages

1. Homepage
2. Topic Page
3. Add Story Page

### The Topic Page:

On the left hand side are the stories related to that topic, on the right hand side is one of the individual stories in full.

On the left hand side, the list of stories are displayed with the following information Date + Title. Stories are listed in chronological order.

The right hand side lists the full story contents. Date: Title: Full Description: Source(s)

By default, if you land on the topic page, the latest story is show on the right hand side.

If a story is unread by the user then on the left hand side, the title is in bold.

**Homepage:**

The homepage is very similar to the topic page except the homepage shows all stories from all topics and listed by chronological order.

**Post New Story**

Posting a new story allows the user themselves to publish a story under the topic.

When a user goes to add a story, a page with the following fields come up:

- Title of Story - text field
- Main Description of story - text field
- Source(s) Unlimited field for source URLs. - URL field
- Topic story will be posted on. Preselected.
- Date of story (Possible for user to backdate story) - Date field
- Submit Button (Once story is submitted, goes into backend for review)

**Misc Functions**

- There is somewhere for me in the backend to add new topics.
- URL structure - I would like the topic page to contain all the content of the stories. So it would be cool to have a structure like `domain.com/topic#story-title`. Is something like this possible? So when you load up `domain.com/topic`, all content from each story appears on `domain.com/topic` in the source code.
- On topic/home pages where the list of stories is on the left hand side, can it load 10-15 stories by default then there is a button that says "load more" This is done via infinite scroll.
- All new stories and edits to existing stories go into a moderation queue in the backend for me to edit/delete/confirm.
- People are able to edit a story. Edited versions go into a moderation queue in the backend for me to edit/delete/confirm.
- The site needs to be responsive. Viewing the content on a mobile, you see just the left hand stories of a topic. Clicking on them loads the topic in full.
